

Lecture 19 - Recursion

Why Recursion?

A fern repeats its pattern at various scales. (Michael , CC BY-NC)

Are fractals the secret to some soothing natural scenes? (Ronan, CC BY-NC-ND)

An example of a recursive addition

Let's define the sum of values from 0 to n as

$$\text{sum}(n) = \begin{cases} 0 & \text{if } n \leq 0 \\ n + \text{sum}(n-1) & \text{if } n > 0 \end{cases}$$

Then we can build a function that matches this.

```

1: def recursive_sum ( n ):
2:     if n <= 0:
3:         return 0
4:     return n + recursive_sum(n-1)
5:
6:
7:
8: # Automated Test
9: if __name__ == "__main__":
10:     n_err = 0
11:     x = recursive_sum ( 5 )
12:     if x != 15:
13:         n_err = n_err + 1
14:         print ( "Error: Test 1: sum not working, expected {} got {}".format ( 15, x ) )
15:     x = recursive_sum ( 0 )
16:     if x != 0:
17:         n_err = n_err + 1
18:         print ( "Error: Test 2: sum conversion not working, expected {} got {}".format ( 0, x ) )
19:
20:     if n_err == 0 :
21:         print ( "PASS" )
22:     else:
23:         print ( "FAILED" )

```

What is a recursive function definition:

$$f(n) = \begin{cases} f(n-1) & n \geq 1 \\ 1 & n < 1 \end{cases}$$

For a positive integer:

$$n! = n * (n-1) * \dots * 2 * 1$$

or

$$f(n) = n * (n-1) * \dots * 2 * 1$$

or

$$f(n) = n * f(n-1)$$

or

$$f(n) = \begin{cases} n \leq 1 : 1 \\ n > 1 : n * f(n-1) \end{cases}$$

Now to Code:

```

1: def calc_factorial(x):
2:     # A recursive function to find the factorial of a number
3:     if x <= 1:
4:         return 1
5:     else:
6:         return (x * calc_factorial(x-1))
7:
8: if __name__ == "__main__":
9:     num = 5
10:    print("The factorial of", num, "is", calc_factorial(num))
11:
12:    err = False
13:    v = calc_factorial(num)
14:    if v != 120:
15:        err = True
16:        print ( "Incorrect result: {n}! Expected {good} got {bad}".format(n=num, good=120, bad=v))
17:
18:    if not err :
19:        print ( "PASS" )
20:    else :
21:        print ( "FAIL" )

```

Compare to an iterative version:

```

1: def factorial_iterative(x):
2:     if x <= 1:
3:         return 1
4:     nn = 2
5:     rv = 1
6:     while ( nn <= x ):
7:         rv = rv * nn
8:     return rv
9:
10: if __name__ == "__main__":
11:     num = 5
12:     print("The factorial of", num, "is", factorial_iterative(num))
13:
14:     err = False
15:     v = factorial_iterative(num)
16:     if v != 120:
17:         err = True
18:         print ( "Incorrect result: {n}! Expected {good} got {bad}".format(n=num, good=120, bad=v))
19:
20:     if not err :
21:         print ( "PASS" )
22:     else :
23:         print ( "FAIL" )

```

A better example is a fractal tree:

Fibonacci Numbers

```
fib(n) = { 0 : n = 0  
          { 1 : n = 1  
          { fib(n-1) + fib(n-2)
```

Weed

```
1: import turtle
2:
3: def tree(length,n):
4:     if length < (length/n):
5:         return
6:     turtle.forward(length)
7:     turtle.left(45)
8:     tree(length * 0.5,length/n)
9:     turtle.left(20)
10:    tree(length * 0.5,length/n)
11:    turtle.right(75)
12:    tree(length * 0.5,length/n)
13:    turtle.right(20)
14:    tree(length * 0.5,length/n)
15:    turtle.left(30)
16:    turtle.backward(length)
17:    return
18:
19: turtle.left(90)
20: turtle.backward(30)
21: tree(200,4)
22:
23: input("Press Enter to continue...")
```

The Koch curve.

So a program to run the Koch curve:
